

Uncle Tom's[™] ROSE TONIC

is a concentrated plant food new to gardening

It contains potassium phosphite as a pure aqueous salt.

Its official EC Fertilizer Value is 0:23:21 in other words it has 10% P and 9% K.

It has nothing else in it at all, and is free from additives, wetters, dyes and impurities.

It is made here in England, where I can make sure everything is done properly. It hasn't been transported half way round the world and hasn't been tested on animals.

DILUTE TO USE

Uncle Tom's Rose Tonic must be diluted at least 1:100 in water before using. For instance, add 50 mls to at least 5 litres of water. Apply this by either spraying the foliage or by watering the soil around the base of the plant. For best results when applying to foliage spray to "Run Off" and when to the soil 300mls of mixture.

Professional growers say that the two most important applications are the FIRST in Spring when the leaf buds are bursting and the LAST in the Autumn as the plant senesces and the Tonic is taken into the system. These two applications are best done by soil application as foliage at that time will be sparse.

Like all remedies and tonics, check plant safety yourself and never overdose.

It mixes OK with almost all diluted garden chemicals other than soft soap.

Always check first. Store out of direct sunlight and frost.

Uncle Tom's[™] ROSE TONIC is recommended by leading members of Roses UK

Uncle Tom says "Say goodbye to lush lanky growth prone to disease, and say hello to healthy plants with more flowers".
